

**Introduction to Drug Utilization Research**  
*Methodological Framework and Research Skills*  
 Associate Professor Lisa Pont  
 (University of Technology Sydney, Australia)

This session was developed on behalf of the ISPE Drug Utilization Special Interest Group by Associate Professor Lisa Pont (University of Technology Sydney, Australia), Professor Katja Taxis (University of Groningen, Netherlands), Associate Professor Bjorn Wettermark (Karolinska Institute, Sweden)

**This session**

- What is Drug Utilization Research (DUR)?
- How does DUR relate to pharmacoepidemiology?
- DUR Conceptual Framework
- Types of DUR research

**Drug Utilization Research**

- "The marketing, distribution, prescription, and use of drugs in a society, with special emphasis on the resulting medical, social and economic consequences" (WHO 1977)

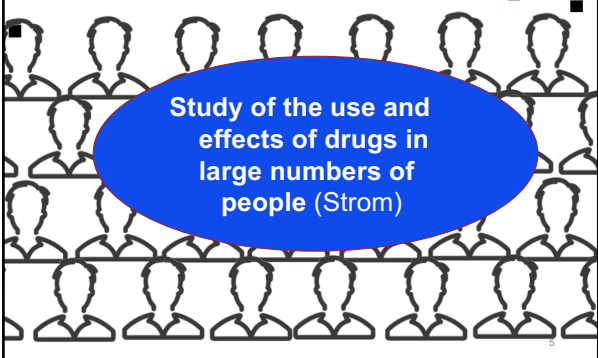

**Current definition**

- "An eclectic collection of descriptive and analytical methods for the quantification, the understanding and the evaluation of the processes of prescribing, dispensing and consumption of medicines, and for the testing of interventions to enhance the quality of these processes." (Wettermark and Vander Stichele, 2008)

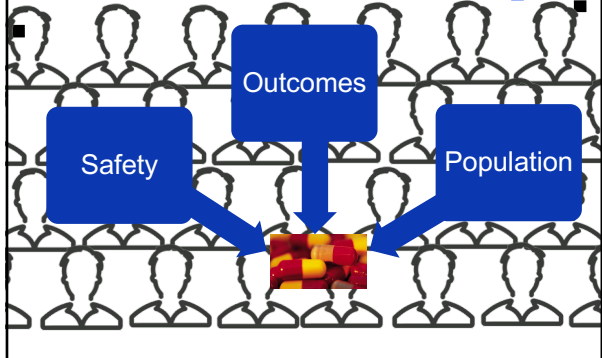

**Pharmacoepidemiology**

Study of the use and effects of drugs in large numbers of people (Strom)

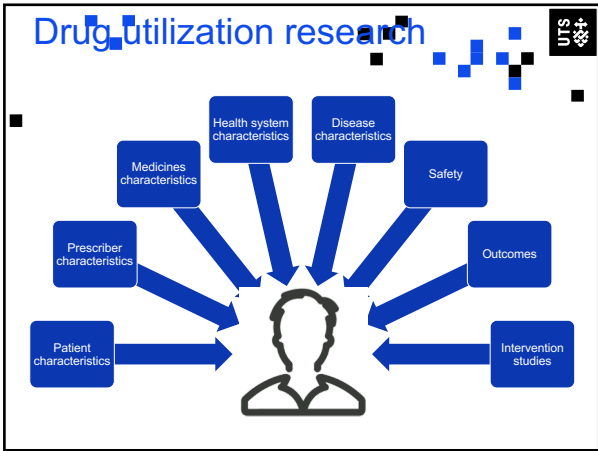

**Pharmacoepidemiology**

The diagram illustrates the relationship between Safety, Outcomes, and Population in pharmacoepidemiology. Three blue boxes labeled 'Safety', 'Outcomes', and 'Population' have arrows pointing towards a central point where a cluster of colorful pills is shown. The background features a grid of person icons.

## Data sources

**Primary data**

- Patients
- Health care providers
- Prescriptions, dispensing records
- Medical records

A collage of three images: a person holding a microphone (interview), a pharmacist in a white coat (health care provider), and a pharmacy aisle with shelves of medicine (prescriptions, dispensing records).

## Data sources

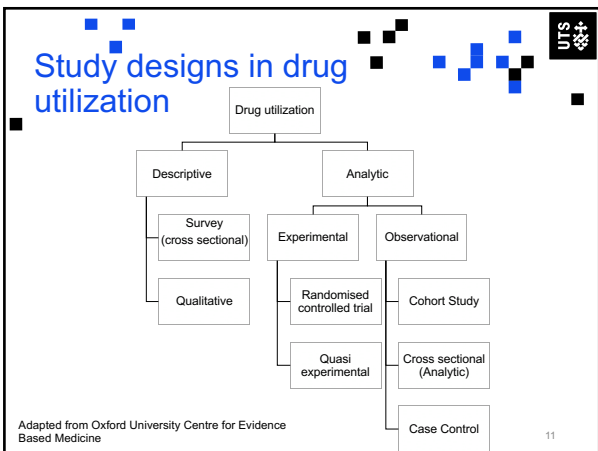

**Secondary data**

- Aggregate data: e.g. sales data
- Individual-level data:
  - electronic health records
  - pharmacy dispensing data
  - reimbursement data
  - patient registries
  - population health survey data
- Linking records from different sources

An illustration of a city skyline with various data and communication icons overlaid, including a cloud, a mail envelope, a Wi-Fi symbol, a smartphone, and a person icon.

## Taxonomy and terminology

- Classification systems
  - Drug eg World Health Organisation ATC classification
  - Disease eg ICD, SNOWMED
- Measurement units
  - Defined daily dose (DDD)
  - Users
- Usage pattern definitions
  - eg Persistence, switching, commencement, cessation

## Conceptual Framework Drug Utilization Research

## Conceptual Framework

**To quantify, understand and improve drug use and health outcomes**

**Micro level**

- Prescribing
- Supplying/dispensing
- Consumption

**Macro level**

- Health System (eg Clinic, hospital, region, country)

## DUR and the conceptual framework

	Quantify	Understand	Evaluate	Improve

The European Journal of Heart Failure

### The relevance of heart failure severity for treatment with evidence-based pharmacotherapy in general practice

Lisa G. Pont<sup>a,\*</sup>, Wick H. van Gilse<sup>a</sup>, Dirk J.A. Lok<sup>b</sup>, Hans J.A. Kragten<sup>c</sup>, Flora M. Haaijer-Ruskamp<sup>a</sup>, on behalf of the Dutch Working Group on Heart Failure

Severity	Minimum evidence-based treatment regime	Crude odds ratio (95% confidence interval)	Adjusted odds ratios (age/sex) (95% confidence interval)	Percentage of patients (95% confidence interval)
NYHA 1 (n=134)	ACEI	3.8 (2.2-6.7)	3.8 (2.1-6.7)	41.0 (32.7-49.4)
NYHA 2 (n=253)	ACEI	7.7 (4.6-12.7)	7.8 (4.6-13.0)	57.5 (52.0-64.2)
NYHA 3 (n=223)	ACEI + β-blocker	1.6 (0.9-2.7)	1.6 (0.9-2.8)	22.4 (17.6-27.8)
NYHA 4 (n=150)	ACEI + β-blocker	1	1	15.3 (9.6-21.1)
Total (n=760)			36.0 (32.6-39.4)	

## RESEARCH

### Prevalence of Potentially Harmful Drug Interactions in Older People in Australian Aged-Care Facilities

Michael J Dolton, Lisa Pont, Gerard Stevens, Andrew J McLachlan

Journal of Pharmacy Practice and Research Volume 42, No. 1, 2012.

**3876 Australian nursing home residents in 26 nursing homes**

**6.1% had a potentially harmful drug interaction**

**The potential drug interaction with the highest prevalence was co-administration of methotrexate and aspirin (38%)**

## Use of antibacterial fixed-dose combinations in the private sector in eight Latin American Countries between 1999 and 2009

## Attitudes of pharmacists to provision of Home Medicines Review for Indigenous Australians

Lindy Swain · Claire Griffiths · Lisa Pont · Lesley Barclay

**Impacts of findings on practice**

- The access of Aboriginal Australians to home medication review needs to be improved.
- Pharmacists and their staff need assistance and training on dealing with the Aboriginal health service and workers.
- Government policies should support and encourage pharmacists to conduct medication reviews for Aboriginal and Torres Strait Islander patients.

### Antihypertensive-related adverse drug reactions among older hospitalized adults

Tariq M. Alhawassi<sup>1,2</sup> · Ines Krass<sup>2</sup> · Lisa G. Pont<sup>3</sup>

Received: 2 May 2017 / Accepted: 20 December 2017 / Published online: 1 February 2018  
 © Springer International Publishing AG, part of Springer Nature 2018

This study shows that antihypertensive medications are associated with an increased risk of an ADR leading to hospital admission for older adults. In our cohort of 500 older adults, one in ten experienced an ADR that was potentially related to their antihypertensive medication either leading to or during their hospital admission.

PHARMACOEPIDEMIOLOGY AND PRESCRIPTION

### Validity of performance indicators for assessing prescribing quality: the case of asthma

Lisa G. Pont · Petra Denig · Thys van der Molen  
 Willem Jan van der Veen · Flora M. Haaijer-Ruskamp

Validation process  
 We validated indicators that targeted sub-optimal treatment patterns related to four steps included in the 1997 National Institutes of Health (NIH) guidelines [12].

- Step 1. Under-treatment of short-acting inhaled  $\beta_2$ -agonists for all asthma patients
- Step 2. Under-treatment of inhaled corticosteroids for mild, moderate or severe persistent asthma
- Step 3. Inadequate dose of inhaled corticosteroids for moderate or severe persistent asthma
- Step 4. Under-treatment of inhaled long-acting  $\beta_2$ -agonists for severe persistent asthma

Indicator	Relevant asthma severity classes targeted by each indicator (number of patients)	Sensitivity	Positive predictive value
Step-1 indicator	All severity classes (n = 146)	0.86 (0.71–0.95)	0.52 (0.38–0.65)
Step-2A indicator	Severity classes 2, 3 & 4 (n = 95)	0.74 (0.57–0.88)	0.46 (0.33–0.60)
Step-2B indicator	Severity classes 2, 3 & 4 (n = 95)	0.37 (0.19–0.58)	0.71 (0.42–0.92)
Step-3 indicator	Severity classes 3 & 4 (n = 36)	0.07 (0.00–0.23)	0.20 (0.00–0.72)
Step-4 indicator	Severity class 4 (n = 16)	Not validated due to inadequate sample size

PHARMACOEPIDEMIOLOGY AND PRESCRIPTION

### Identifying general practice patients diagnosed with asthma and their exacerbation episodes from prescribing data

Lisa G. Pont · G.Th. van der Werf  
 P. Denig · F.M. Haaijer-Ruskamp

Asthma exacerbation identification criteria	Sensitivity (95% CI)	Specificity (95% CI)	Positive predictive value (95% CI)	Negative predictive value (95% CI)
Short-course oral corticosteroid	0.23 (0.20–0.28)	0.99 (0.99–0.99)	0.67 (0.59–0.75)	0.93 (0.92–0.94)
Short-course oral corticosteroid or short-course antibiotic	0.55 (0.50–0.60)	0.96 (0.96–0.97)	0.58 (0.53–0.63)	0.95 (0.95–0.96)

IJPP Pharmacy Practice International Journal of Pharmacy Practice 2017, 25, pp. 66–74

### Validity of prescribing indicators for assessing quality of antibiotic use in Australian general practice

Lisa G. Pont<sup>1</sup>, Tessa K. Morgan<sup>2</sup>, Margaret Williamson<sup>3</sup>, Flora M. Haaijer<sup>4</sup> and Mieke L. van Driel<sup>5</sup>

<sup>1</sup>Centre for Health Systems and Safety Research, Australian Institute of Health Innovation, Macquarie University, North Ryde, <sup>2</sup>NPS MedicineWise, Sydney, NSW, Australia, <sup>3</sup>University of Groningen, Groningen, The Netherlands and <sup>4</sup>University of Queensland, Brisbane, QLD, Australia

Drug-specific indicators	Validity for monitoring antibiotic resistance	Validity for monitoring benefit to individual patients	Validity for monitoring harm to individual patients	Validity for policy makers
1. Consumption of all antibiotics for systemic use	7 (1.5)	4 (1.9)	7 (25.8)	8 (5.5)
2. Consumption of penicillins	7 (5.4)	7 (1.8)	8 (97.8)	8 (5.4)
3. Consumption of cephalosporins	7 (2.4)	7 (1.8)	8 (11.5)	8 (2.5)
4. Consumption of macrolides	7 (2.7)	7 (4.3)		
5. Consumption of quinolones	8 (2.4)	6 (2.5)		
6. Consumption of combination penicillins	7 (4.3)	4 (1.9)		
7. Consumption of third and fourth-generation cephalosporins	8 (6.3)	7 (2.4)		
8. Consumption of quinolones	8 (4.3)	4 (1.7)		
9. Ratio broad-spectrum to narrow-spectrum antibiotics	7 (3.4)	7 (3.5)		
10. Consumption of antibiotics commonly used for upper respiratory tract infections (URTI)	7 (1.5)	7 (1.5)		

Antibiotics are indicated for acute cystitis. There is no value in monitoring their use in terms of quality of prescribing. Monitoring which ones are used would be of value. GP 4

Not sure how relevant this is, as it is common practice to give antibiotics for urinary tract infection, the type and duration of treatment much more relevant. GP 1

### Treatment quality indicators predict short-term outcomes in patients with diabetes: a prospective cohort study using the GIANTT database

Grigory Sidorenkov,<sup>1,2</sup> Jaco Voorham,<sup>1,2</sup> Dick de Zeeuw,<sup>1</sup> Flora M Haaijer-Ruskamp,<sup>1,2</sup> Petra Denig<sup>1,2</sup>

Prescribing indicator: "a measurable element of prescribing performance for which there is evidence or consensus that it can be used to assess quality"

Figure 1. Observed change (with 95% CI) in the four health-related quality indicators, when for each indicator the quality indicator is present (red) or absent (green) (n=1000). The forest plots show the predicted change in LDL-C (mmol/L), SBP (mmHg), and ACR (mg/mmol) for each quality indicator (CT, TS, TI) across various quality indicators (LDL-C, SBP, ACR). The x-axis represents the predicted change, and the y-axis lists the quality indicators. The legend indicates that red bars represent the presence of the quality indicator and green bars represent its absence.

### Challenges in Drug Utilization Research

"I think you should be more explicit here in step two."

48

### Challenges in drug utilization research

- Descriptive quantitative studies may have problems with poor data validity and limited generalizability
- Analytical studies may suffer from the same problems as all pharmacoepidemiological studies, i.e., variation by chance, bias and confounding

### Correlation between Annual Per Capita Chocolate Consumption and the Number of Nobel Laureates per 10 Million Population.

Messerli FH. N Engl J Med 2012;367:1562-1564.

### Association between storks and newborn babies in Western Germany 1965-1980

Sies H. Nature 332:495

### Final thoughts

- Drug utilization research
- explores practice based issues
- using varied methodologies and data sources
- putting the prescriber, supplier and consumer at the centre of the research
- to inform and improve health practice, policy and patient outcomes.

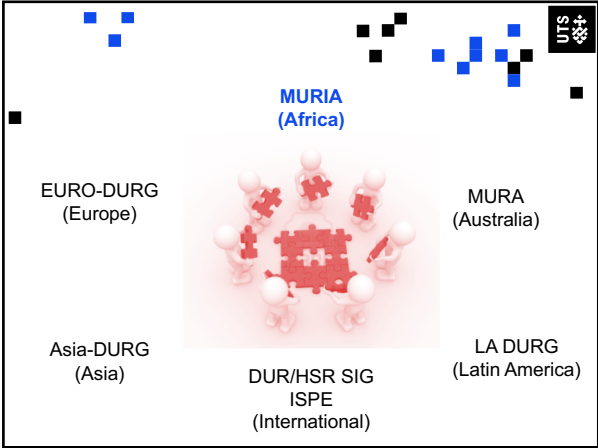

### Drug Utilization Research Methods and Applications

Monique Elseviers, Björn Wettermark, Anna Birna Almarsdóttir, Morten Andersen, Ría Benko, Marion Bennie, Irene Eriksson, Brian Godman, Janet Krka, Elisabetta Poluzzi, Katja Taxis, Vera Vlahovic-Palcevski, Robert Vander Stichele

Drug Utilization Research (DUR) is an eclectic scientific discipline, integrating descriptive and analytical methods for the quantification, understanding and evaluation of the processes of prescribing, dispensing and consumption of medicines and for the testing of interventions to enhance the quality of these processes. The discipline is closely related and linked mainly to the broader field of pharmacoepidemiology, but also to health outcomes research, pharmacovigilance and health economics.
